Subject: Celebrity HAMS

>The newest Newsline claims that Marlon Brando has had many different
>ham calls, and that a biographer is looking for people who may have
>had contacts with him. I looked up Brando on marvin, with no results.
>He probably has a real name that he has on his license.

Yes, Marlon Brando's call was under his real name (which I don't remember at the moment) and if I also remember correctly, he let his US license expire when he retired cause he settled down in Tahiti. He fell in love with the island during the filming of "Mutiny on the Bounty" and also held a ham license from there for many years. Actually a better solution might be to look in the INTERNATIONAL volume of the CALL BOOK cause I don't imagine there are all that many hams in Tahiti. As a matter of fact I think I will when I get home today.
More info to follow.

Does anyone remeber the call signs of:
Arthur Godfrey, Clayton Moore (The Lone Ranger)

But both systems are ARBITRARY. Neither is really better than the other. I really cannot see that a system based on the distance from the North Pole to the Equator passing through Paris (based on an incorrect survey)

and various properties of water is any more logical than one based on the average length of a man's foot.

It is about time that all these units were swept away and replaced by a logically consistent set based on universal physical constants such as the velocity of light in vacuo, Planck's and Boltzmann's constants and the universal gravitational constant.

The much-vaunted "consistency" of SI only comes about by giving some quantities fictitious dimensions divorced from physical reality. B and H should logically have the same dimensions (which they do in cgs units) as should D and E. A thoroughly confusing situation.

Subject: Sailing and HAMS

Have any of you hams every talked with round-the-world sailors or those in ocean-going races etc.?

Curiously,

js

Bob Parnass, AJ9S - AT&T Bell Laboratories - att!ihuxz!parnass (708)979-5414

Date: Thu, 16 Nov 89 13:10:27 GMT

From: "Pete Lucas, NCS-TLC 0793-411613" <PJML@IBMA.NERC-WALLINGFORD.AC.UK

I've got a Regency HX2000E Scanner (I think the 'E' designates it as a
'European' model) coverage 60-89, 118-174 and 406-512MHz.

It is troubled by two serious symptoms::

1) In-band spurii, particularly in the 60-89MHz band, so strong as to open the

squelch and stop scanning.

- 2) Synthesizer whine accompanied by a 'wobbly' spurious, that creeps HF to LF for about 10 minutes after switch-on. I think that this is the LCD Display multiplexing oscillator, as it stops when i disconnect the display power feed.

I have taken the thing to pieces and made sure that the shielding cover of the microprocessor/display is adequately soldered to the PCB, also added a number of 1nF decouplers at what look obvious places (power supply feed to synthesizer, across battery terminals, across the tuning-voltage-to-frontend feeds) and this has made a slight improvement. Anyone else got one of these beasties and cured the noise? Or should i start putting ferrite beads on all the non-RF wiring?

++Pete
